

# Substance Use Patterns of Ecstasy Users: EDM event visitors in the UK and the Netherlands.

Part of the ALAMA Nightlife Project

## The Netherlands

Ruben van Beek, MSc.  
Dr. Matthijs Blankers  
Prof. Marloes Kleinjan  
Dr. Margriet van Laar  
& all other ALAMA team members

Netherlands Institute of  
Mental Health and Addiction

## United Kingdom

Jon Waldron, MSc.  
Dr. Meryem Grabski  
Dr. Tom Freeman  
Prof. Val Curran

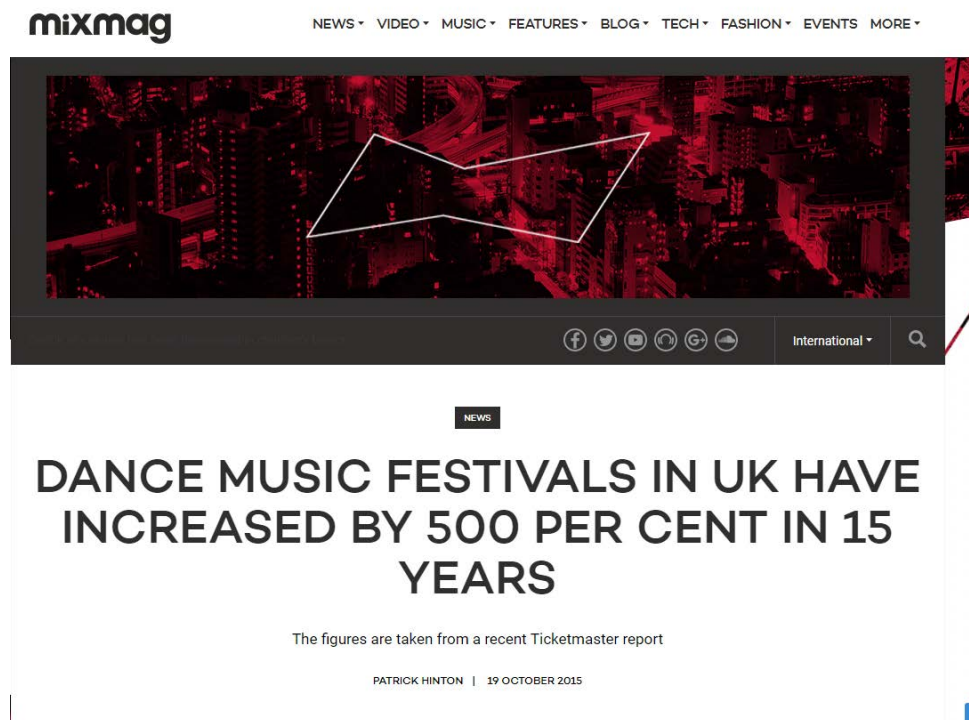

# Overview

- Background
- Aims
- Methods
- Results
- Conclusions

# Background

- Increase in nightlife economy (Electronic Dance Music in particular) (MixMag.com, Respons.nl Festival Monitor)

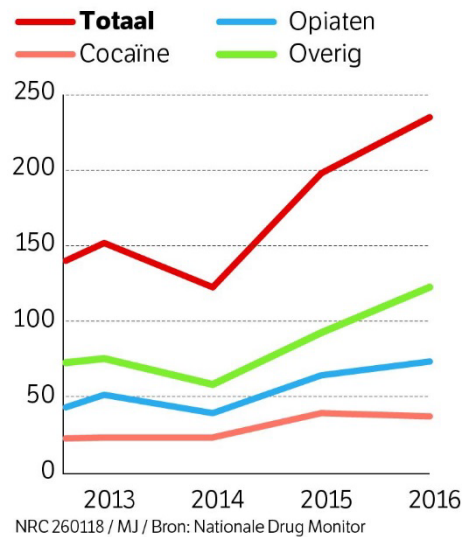

# Background

- Increase in nightlife economy
- Drugs are used in the nightlife (Mark 'Gurning Rave Guy', internet)

# Background

- Increase in nightlife economy
- Drugs are used in the nightlife
- Increase in drug related deaths (National Drug Monitor, 2017)

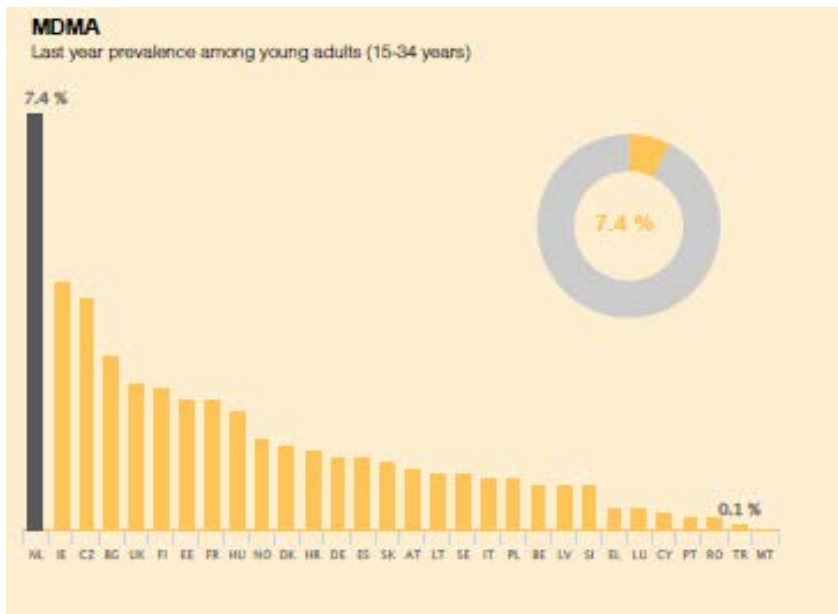

# Background

- Increase in nightlife economy
- Drugs are used in the nightlife
- Increase in drugs related deaths
- Poly-drug health incidents are increasing (Monitor Drug Incident, 2018)

# Background

- Ecstasy is most used (illicit) in the Netherlands (EMCDDA Country Report Netherlands , 2018)

- Finding subtypes of MDMA user may help prevention/harm reduction efforts

# Background

- Subtype research so far:
  - Different populations (MDMA users, high school students, nightlife attendees, etc.) (Carlson, Wang, Falck, & Siegal, 2005; Brooks-Russell et al., 2015; Hanneman, Kraus, Piontek, 2017 )
  - Different countries (Germany, Brasil, USA, etc.) (Hanneman, Kraus, Piontek, 2017; Sanudo, Andreoni, & Sanchez, 2015; Fernández-Calderón, Cleland, & Palamar, 2018)
  - Mostly urban areas (Hanneman, Kraus, Piontek, 2017; Sanudo, Andreoni, & Sanchez, 2015; Fernández-Calderón, Cleland, & Palamar, 2018)
- Studies mostly find 3 or 4 subtypes
  - Low, moderate, and high, sometimes with an additional stimulant or psychedelic subgroup

# Background

- Limitations of subtype research so far
  - Mostly single city studies (München, Sao Paolo, New York) (Hanneman, Kraus, Piontek, 2017; Sanudo, Andreoni, & Sanchez, 2015; Fernández-Calderón, Cleland, & Palamar, 2018)
  - Often a small selection of substances
  - None in the Netherlands, none recently in the United Kingdom
  - None directly comparing different countries

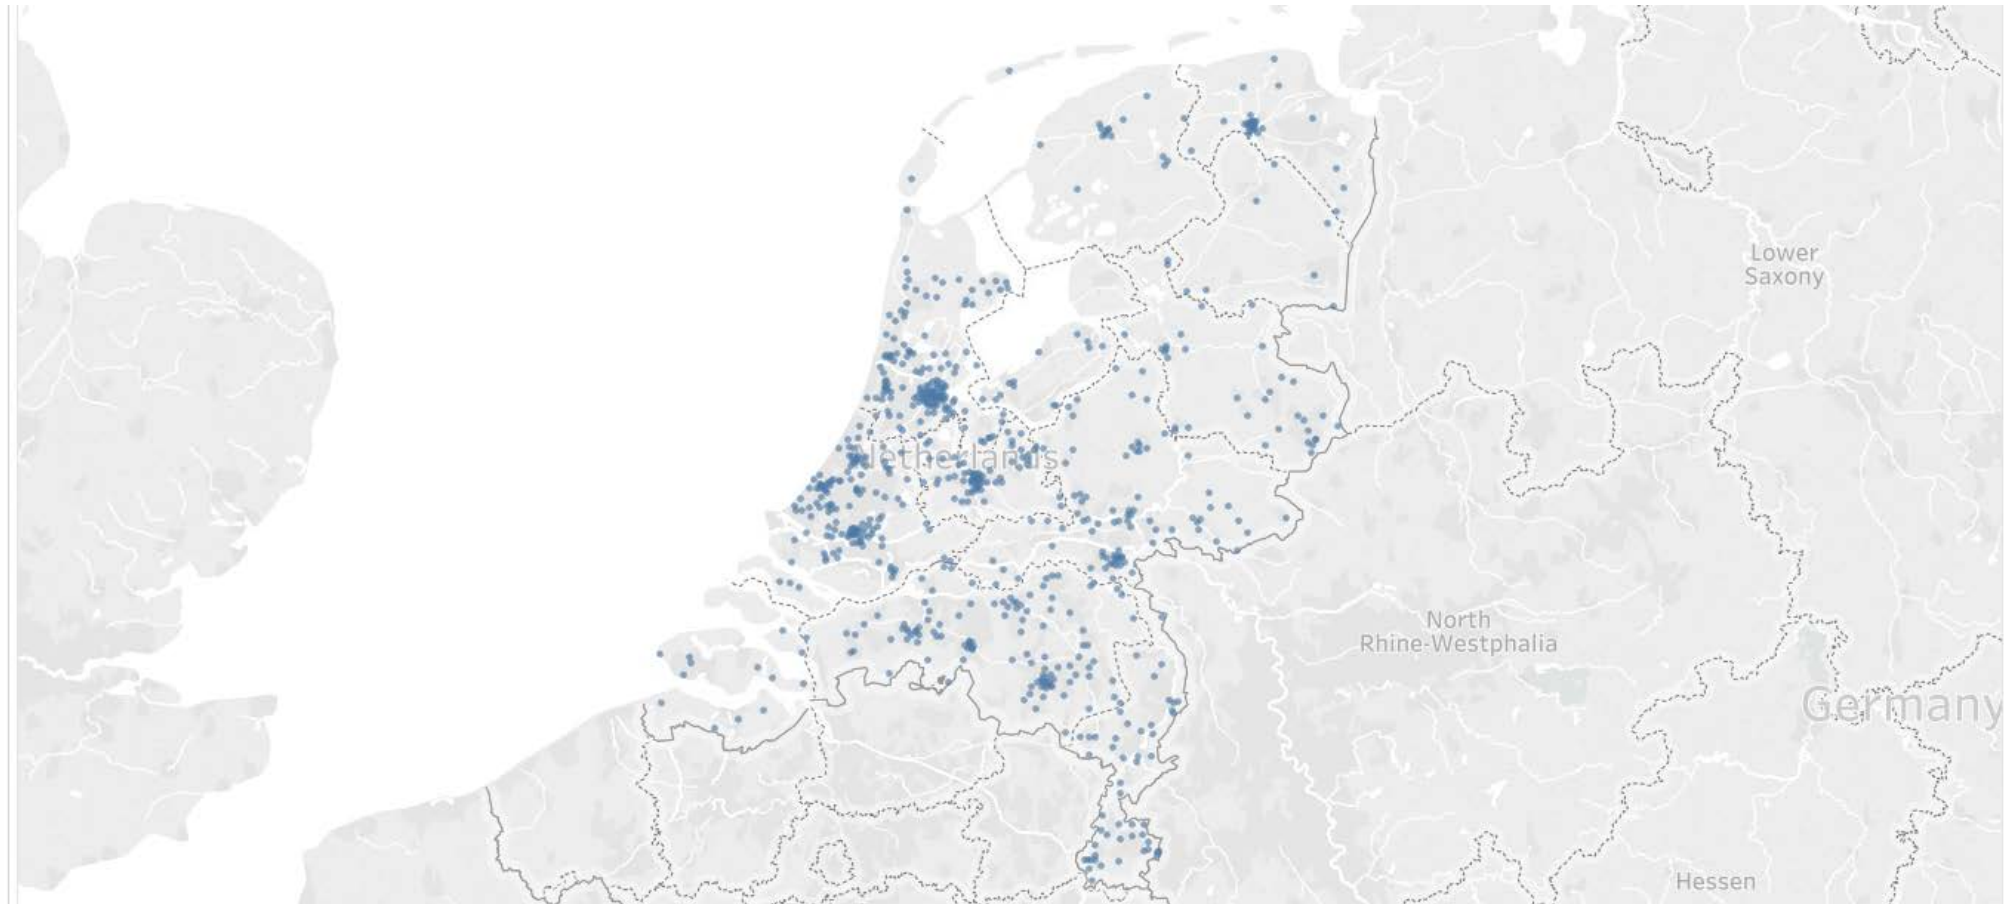

# Aims

- To find subtypes of ecstasy users in the Electronic Dance Music scene in the United Kingdom and the Netherlands using Latent Class Analysis
  - Do subtypes differ in terms of substances used?
  - Do subtypes differ between the UK and NL?
  - Do these subtypes differ in terms of their intention to change drug use?

# Methods

- ALAMA project
  - Electronic Music Scene Survey (EMSS, UK and NL data)
- Sampling online + offline (> 6 EDM events LY, > 3 MDMA LY)
- Analysis: Latent Class Analysis
- Indicators for LCA
  - Last Year Substance use: Alcohol, Tobacco, Cannabis, Synthetic Cannabinoids, Benzodiazepines, Prescription Opiates, Heroin, LSD, Magic Mushrooms, DMT, Synthetic Hallucinogens, Cocaine, Amphetamine, 4F-A, MDA, Mephedrone, Nitrous Oxide, GHB, Ketamine, Synthetic dissociatives, Amyl Nitrates.
- Intention to change substance use
- R 3.6 (PoLCA 1.4.1, GGplot 3.1.1) and Mplus 7.2.

# Results

Low polydrug use group

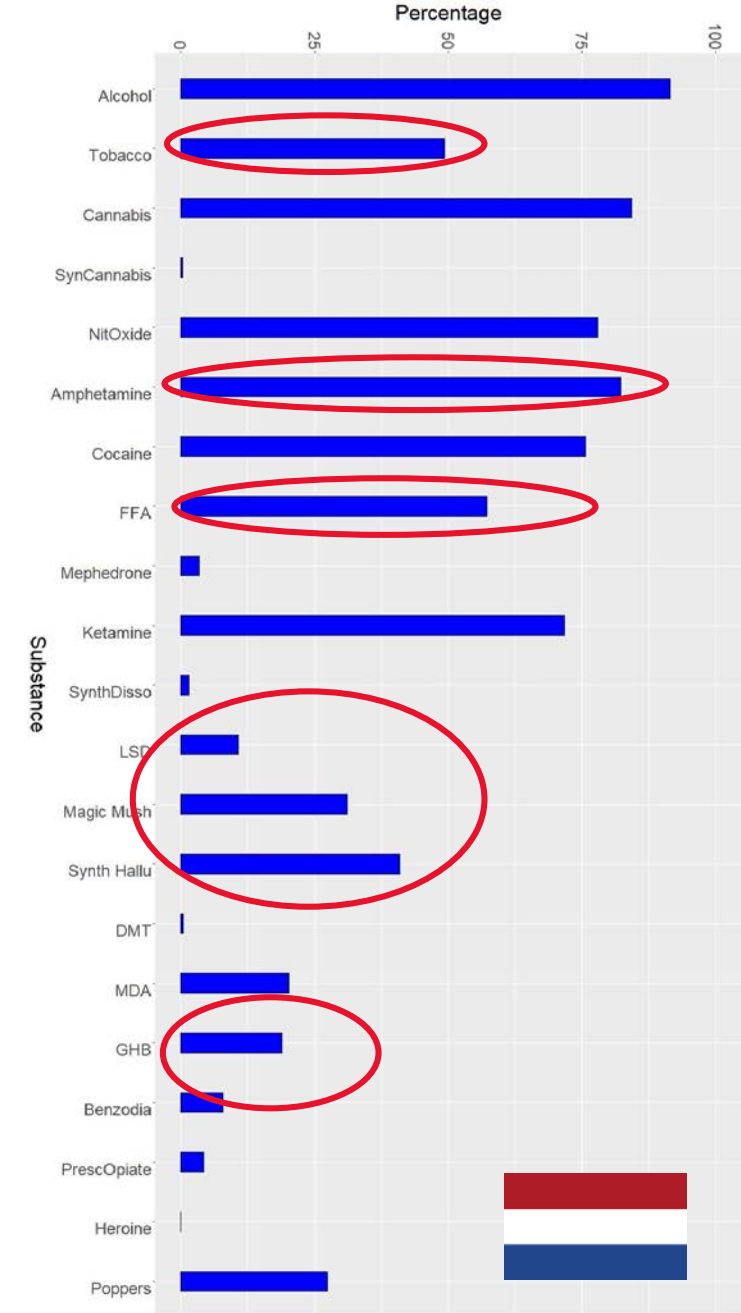

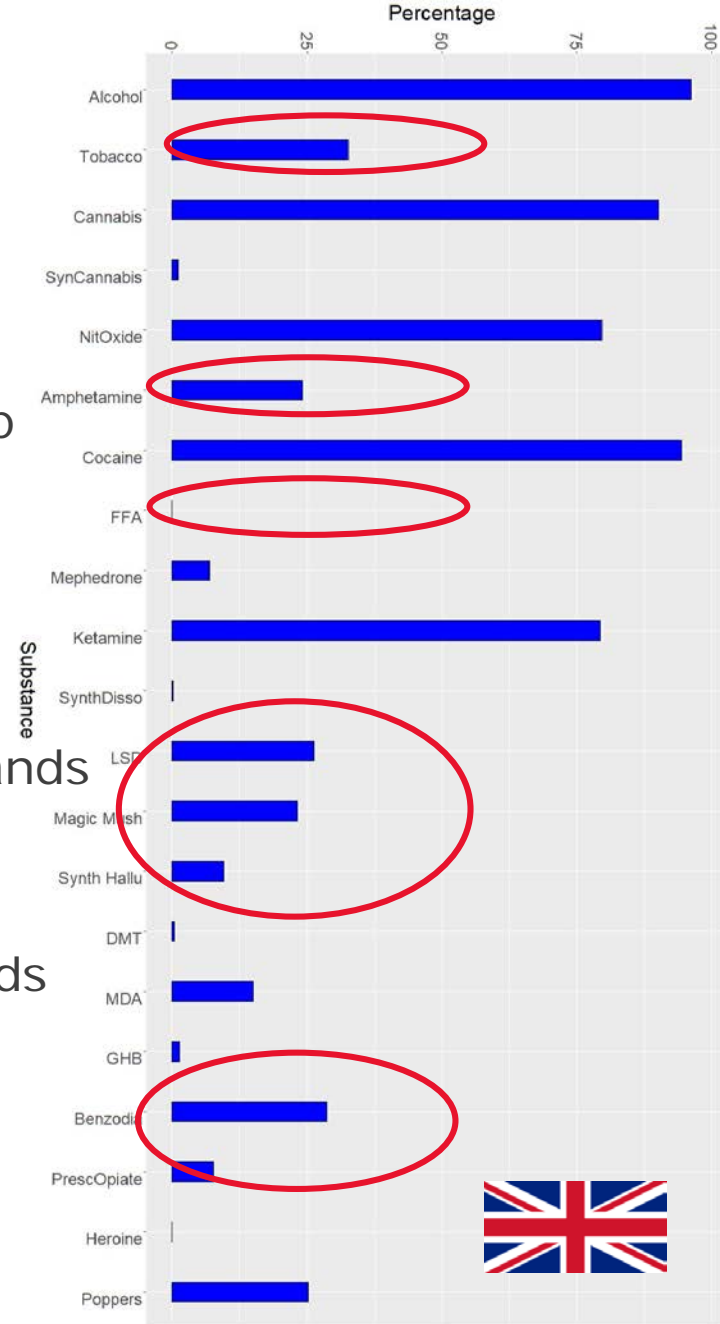

- 28.4% UK
- 39.6% NL
- Difference in distribution of stimulants
- Ketamine & LSD higher in UK

# Results

## Moderate polydrug use group

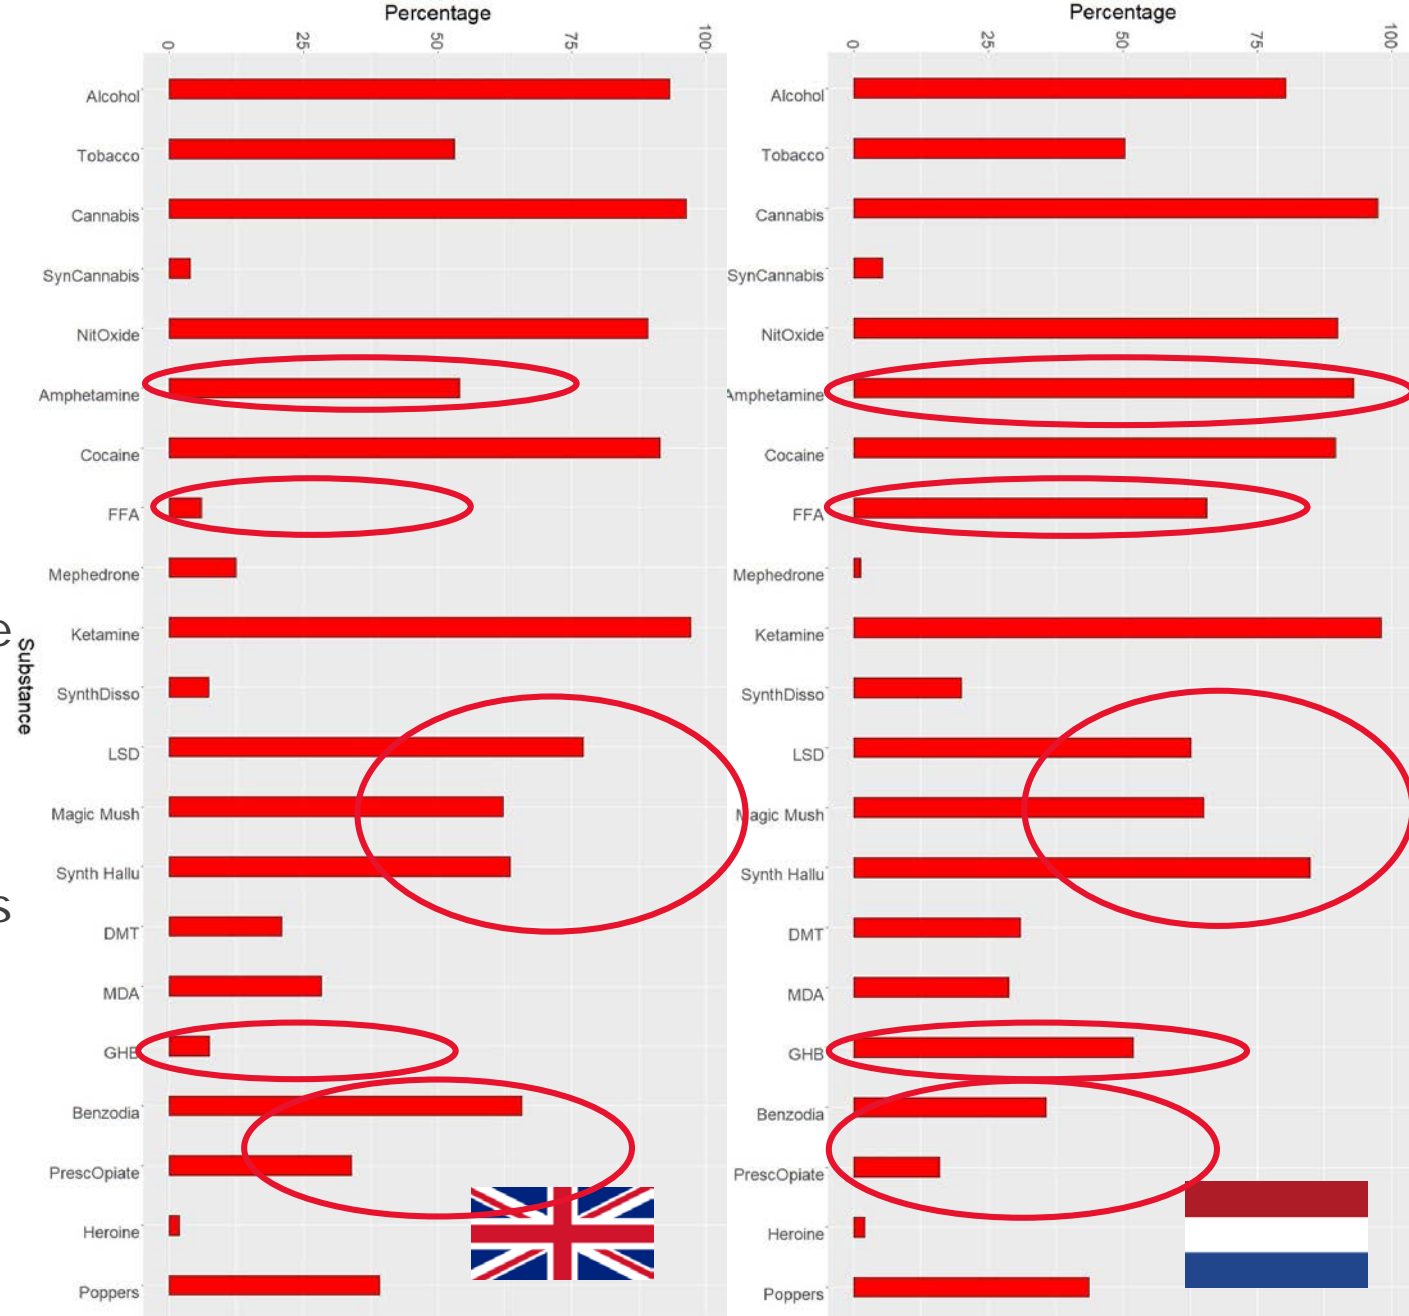

- 47.6% UK
- 52.9% NL
- Tobacco use lower in UK
- Amphetamine and 4F-A use higher in the Netherlands
- Difference in distribution of psychedelics
- GHB use in the Netherlands
- Use of benzo's in the UK

# Results

## High polydrug use group

- 24.0% UK
- 7.5% NL
- Amphetamine and 4F-A use higher in the Netherlands
- Difference in distribution of psychedelics
- GHB use in the Netherlands
- Use of benzo's and prescription opiates in the UK

# Results

UK		Class 1 (Low polydrug use group)	Class 2 (Moderate polydrug use group)	Class 3 (High polydrug use group)	
Intention	Yes - I intend to stop using alcohol and/or drugs	3.6%	1.4%	1.6%	
	Yes - I intend to decrease my use a lot	10.8%	13.1%	15.1%	
	Yes - I intend to decrease my use a little	31.4%	42.9%	45.3%	
	No - I intend my drug use to stay the same	49.3%	37.2%	34.5%	
	Yes - I intend to increase my use a little	4.9%	5.5%	3.5%	
	Yes - I intend to increase my use a lot	0.0%	0.0%	0.0%	$X(8) = 26.674,$ $p = .001,$ Cramer's $V = .111$

# Results

NL		Class 1 (Low polydrug use group)	Class 2 (Moderate polydrug use group)	Class 3 (High polydrug use group)	
Intention	Yes - I intend to stop using alcohol and/or drugs	1.5%	0.2%	1.1%	
	Yes - I intend to decrease my use a lot	5.1%	10.0%	13.6%

# Conclusions

- We found three subtypes (low, moderate, & high) of ecstasy users in both countries.
  - But! The distribution of groups is different, high polydrug use group is smaller in NL
- They are similar in some respects
  - Cannabis, alcohol, nitrous oxide, stimulant use
- But they also differ
  - Stimulant preferences, psychedelic preferences
  - Cocaine and ketamine slightly more popular in UK
  - Use of prescription drugs more prevalent in UK
- Most regular ecstasy users do not have the desire to stop use
  - The majority of the low polydrug groups mostly want to remain using the same
  - Heavy polydrug use ecstasy users have a higher intention to decrease use, but only a little a little
